Definition of a Matrix

If m and n are positive integers, an $m \times n$ matrix (read m by n) is a rectangular array

$$\begin{bmatrix}
 a_{11} & a_{12} & a_{13} & \dots & a_{1n} \\
 a_{21} & a_{22} & a_{23} & \dots & a_{2n} \\
 a_{31} & a_{32} & a_{33} & \dots & a_{3n} \\
 \vdots & \vdots & \vdots & \dots & \vdots \\
 a_{m1} & a_{m2} & a_{m3} & \dots & a_{mn}
 \end{bmatrix}$$

in which each entry, a_{ij} , of the matrix is a number. An $m \times n$ matrix has m rows (horizontal lines) and n columns (vertical lines)

We use a capital letter to represent a matrix. For example

$$A = \begin{bmatrix} -1 & 9 \\ 5 & -2 \end{bmatrix}, \quad B = \begin{bmatrix} \frac{1}{3} \\ 0 \\ \sqrt{2} \end{bmatrix}, \quad C = \begin{bmatrix} 2 & -9 & 0 & 4 \\ -4 & 3 & 5 & -7 \\ 0 & -1 & 7 & 6 \end{bmatrix}$$

Notice that in A , there are 2 rows across and 2 columns down

We say that the order of A is 2×2 or A is a 2×2 matrix.

in B , there are 3 rows across and 1 column down

We say that the order of B is 3×1 or B is a 3×1 matrix.

in C , there are 3 rows across and 4 columns down

We say that the order of C is 3×4 or C is a 3×4 matrix.

Some special matrices :

1
ex

1. Zero matrix

$$\begin{bmatrix} 0 & 0 \\ 0 & 0 \end{bmatrix}, \begin{bmatrix} 0 & 0 & 0 \\ 0 & 0 & 0 \\ 0 & 0 & 0 \end{bmatrix}$$

2
ex

2. Row matrix

$$[-1 \ 3 \ 7], [3 \ 5 \ -2 \ -8]$$

3
ex

3. Column matrix

$$\begin{bmatrix} \sqrt{2} \\ 1 \\ 7 \end{bmatrix}, \begin{bmatrix} 6 \\ 4 \\ -5 \\ 0 \\ -9 \end{bmatrix}$$

4. Square matrix

$$\begin{bmatrix} 2 & -7 \\ 0 & 9 \end{bmatrix}, \begin{bmatrix} 4 & 3 & -5 \\ 6 & 0 & 1 \\ -9 & 8 & 0 \end{bmatrix}$$

4
ex

5. Identity matrix

$$I_2 = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}, I_3 = \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}$$

Two matrices are said to be **equal** if they are of the same order and their corresponding elements are equal.

From matrices A, B, C and D : Are there any pairs that are equal ?

$$A = \begin{bmatrix} -2 & \frac{9}{3} & \sqrt{25} \\ 0 & 1 & \pi \end{bmatrix}, \quad B = \begin{bmatrix} \sqrt{4} & 3 & 5 \\ 0 & 1^5 & \pi \end{bmatrix}$$
$$C = \begin{bmatrix} -2 & \sqrt{9} & 5 \\ 0 & 5^0 & \frac{22}{7} \end{bmatrix}, \quad D = \begin{bmatrix} 2 & \frac{6}{2} & \sqrt{(-5)^2} \\ -0 & 0.9 & \pi \end{bmatrix}$$

Let matrix A **equal to** matrix B ; find x, y, z and w.

$$A = \begin{bmatrix} x+y & -\sqrt{4} \\ w & 4.9 \end{bmatrix}, \quad B = \begin{bmatrix} \log_2 2 & y \\ \frac{1}{2^{-2}} & w-z \end{bmatrix}$$

Addition, Subtraction, and Scalar Multiplication of Matrices

Matrix addition

$$\text{If } A = \begin{bmatrix} a & b \\ c & d \end{bmatrix} \text{ and } B = \begin{bmatrix} e & f \\ g & h \end{bmatrix}, \text{ then } A+B = \begin{bmatrix} a+e & b+f \\ c+g & d+h \end{bmatrix}$$

Matrix Subtraction

$$\text{If } A = \begin{bmatrix} a & b \\ c & d \end{bmatrix} \text{ and } B = \begin{bmatrix} e & f \\ g & h \end{bmatrix}, \text{ then } A - B = \begin{bmatrix} a-e & b-f \\ c-g & d-h \end{bmatrix}$$

Scalar Multiplication

$$\text{If } A = \begin{bmatrix} a & b \\ c & d \end{bmatrix} \text{ then } kA = \begin{bmatrix} ka & kb \\ kc & kd \end{bmatrix} \text{ where } k \text{ is a number}$$

Example
ans

$$\text{If } A = \begin{bmatrix} -4 & 3 \\ 1 & 2 \end{bmatrix} \text{ and } B = \begin{bmatrix} 2 & -5 \\ -1 & 8 \end{bmatrix} \text{ find } \frac{1}{5}A - \frac{1}{7}B$$

$$\begin{bmatrix} \frac{4}{5} - \frac{2}{7} & \frac{3}{5} - \frac{(-5)}{7} \\ \frac{1}{5} - \frac{(-1)}{7} & \frac{2}{5} - \frac{8}{7} \end{bmatrix}$$

Multiplication of Matrices

The product of two matrices A and B is defined only when the number of columns in A is equal to the number of rows in B.

Matrices	A	B
Dimensions	$m \times p$	$p \times n$

columns in A

rows in B

The product AB is a matrix of dimension $m \times n$

$$\begin{matrix} \mathbf{A} & \times & \mathbf{B} & = & \mathbf{C} \\ m \times \mathbf{p} & & \mathbf{p} \times n & & m \times n \end{matrix}$$

Week 2 (27 August 2021)

Given $A = \begin{bmatrix} -2 & 3 \\ 5 & -1 \end{bmatrix}$, $B = \begin{bmatrix} -1 & -7 \\ 3 & 0 \end{bmatrix}$, $C = \begin{bmatrix} 3 & 0 & 9 \\ -1 & 5 & -2 \end{bmatrix}$ and $D = \begin{bmatrix} -2 & 1 \\ 7 & -5 \\ 0 & -8 \end{bmatrix}$

find

(a) $A \times B$, $B \times A$

(b) $A \times C$, $C \times A$

(c) $B \times D$, $D \times B$

(d) $C \times D$, $D \times C$

(b) $A \times C$ $\begin{matrix} A & \times & C \\ 2 \times 2 & & 2 \times 3 \end{matrix} = E$ $\begin{matrix} & & & & \\ & & & & 2 \times 3 \end{matrix}$

$$\begin{bmatrix} -2 & 3 \\ 5 & -1 \end{bmatrix} \times \begin{bmatrix} 3 & 0 & 9 \\ -1 & 5 & -2 \end{bmatrix} = \begin{bmatrix} (-2)3 + 3(-1) & 15 & -24 \\ 16 & -5 & 47 \end{bmatrix}$$

(b) $C \times A$ $\begin{matrix} C & \times & A \\ 2 \times 3 & & 2 \times 2 \end{matrix}$ cannot be multiplied
